Introdução a Programação com Python [26E1_2]

Strings (str)

Operador []

```
hello = 'hello python'
print(hello)
```

```
hello python
```

```
print(type(hello), hello)
```

```
<class 'str'> hello python
```

```
hello[2]
```

```
'l'
```

```
hello[5]
```

```
','
```

```
hello[-6]
```

```
'p'
```

Substring com slicing

- [:] extracts the entire sequence from start to end.
- [start :] specifies from the start offset to the end.
- [: end] specifies from the beginning to the end offset minus 1.
- [start : end] indicates from the start offset to the end offset minus 1.
- [start : end : step] extracts from the start offset to the end offset minus 1, skipping characters by step.

```
hello[2:7]
```

```
'llo p'
```

```
hello[1:10:3]
```

```
'eoy'
```

```
hello[-8:]
```

```
'o python'
```

```
hello[:-3]
```

```
'hello pyt'
```

```
print('Wanderson', hello[::-1])  
print('Alexandre', hello[-1:-6])  
print('Alexandre e Matheus', hello[-1:-7:-1])
```

```
Wanderson nohtyp olleh  
Alexandre  
Alexandre e Matheus nohtyp
```

```
print(hello[:-7:-1]) #nohtyp  
print(hello[:-7]) #hello
```

```
nohtyp  
hello
```

Funções úteis para manipular strings

```
type(hello)
```

```
str
```

```
nome = 'Gesiel Lopes'  
type(nome)
```

```
str
```

```
curso = 'INTRODUCAO A PROGRAMACAO COM PYTHON'  
type(curso)
```

```
str
```

```

# upper()
print('upper:', hello.upper())
# lower()
print('lower:', nome.lower())
# isupper() e islower()
print('isupper:', hello.isupper())
print('isupper:', curso.isupper())
print('islower:', hello.islower())
print('islower:', curso.islower())
# swapcase()
print('swapcase:', hello.swapcase())
print('swapcase:', curso.swapcase())
print('swapcase:', nome.swapcase())
# capitalize()
print('capitalize:', hello.capitalize())
print('capitalize:', nome.capitalize())
print('capitalize:', curso.capitalize())
# title()
print('title:', hello.title())
print('title:', nome.title())
print('title:', curso.title())
# replace()
print('replace:', hello.replace(' ', '--'))
print('replace:', curso.replace('A', '4'))
# len()
print('len:', len(hello))
print('len:', len(curso))
# split()
print('split:', hello.split(' '))
print('split:', nome.split('p'))
print('split:', curso.split('A'))
# join()
string_list = [hello, nome, curso]
print('string_list', string_list)
using_join_in_string_list = ', '.join(string_list)
print('using_join_in_string_list', using_join_in_string_list)
# strip()
print('strip:', hello.strip())
print('strip:', nome.strip())
print('strip:', curso.strip())

```

```

upper: HELLO PYTHON
lower: gesiel lopes
isupper: False
isupper: True
islower: True
islower: False
swapcase: HELLO PYTHON
swapcase: introducao a programacao com python
swapcase: GESIEL LOPES
capitalize: Hello python
capitalize: Gesiel lopes
capitalize: Introducao a programacao com python
title: Hello Python
title: Gesiel Lopes
title: Introducao A Programacao Com Python
replace: hello--python
replace: INTRODUCAO 4 PROGRAM4M4C40 COM PYTHON
len: 12
len: 35
split: ['hello', 'python']
split: ['Gesiel Lo', 'es']
split: ['INTRODUC', 'O ', ' PROGR', 'M', 'C', 'O COM PYTHON']
string_list ['hello python', 'Gesiel Lopes', 'INTRODUCAO A PROGRAMACAO COM PYTHON']
using_join_in_string_list hello python, Gesiel Lopes, INTRODUCAO A PROGRAMACAO COM PYTHON
strip: hello python
strip: Gesiel Lopes
strip: INTRODUCAO A PROGRAMACAO COM PYTHON

```

```
help(curso.strip)
```

Help on built-in function strip:

```
strip(chars=None, /) method of builtins.str instance
    Return a copy of the string with leading and trailing whitespace removed.

    If chars is given and not None, remove characters in chars instead.
```

```
# strip()
print('strip:', hello.strip('n'))
print('strip:', nome.strip('s'))
print('strip:', curso.strip('N'))
```

```
strip: hello pytho
strip: Gesiel Lope
strip: INTRODUCAO A PROGRAMACAO COM PYTHO
```

```
strip_exemple = '    exemplo de strip    '
print('strip_exemple:', strip_exemple)
print('strip_exemple:', strip_exemple.strip())
```

```
strip_exemple:    exemplo de strip
strip_exemple: exemplo de strip
```
